MESH × SIMAN LABS

Check before you trust.

An Evidence Passport for every digital claim: live sources, independent AI assessments, and a tamper-evident receipt.

WORKING PRODUCT · LIVE ON ETHEREUM SEPOLIA

Claims travel faster than evidence.

A post becomes a screenshot becomes a forward. By the time someone acts on it, the source, the date and the uncertainty are gone.

Mesh reconnects the claim to its evidence, and makes the result checkable.

01 Investigations don’t travel

Every platform re-checks the same claim from scratch. Nothing portable follows it.

02 One model, one blind spot

A single AI summary hides disagreement and sounds more certain than the evidence allows.

03 Results can be quietly changed

A verdict on a website can be edited or deleted. There's no receipt to check it against.

One claim in.
One passport out.

Paste text, a link or a screenshot. Mesh returns a public, portable record of the investigation, not just a verdict.

EVIDENCE PASSPORT

pm_gUTTfg0wdeKA · v1

UNVERIFIED · 65

4	atomic claims, weighted by importance
16	evidence items: supporting, opposing, neutral
2	independent assessments, with disagreement recorded
1	adversarial challenge, resolved and explained
0–100	deterministic Truth Score + confidence
⛓	claims root · evidence root · passport hash · Sepolia receipt

FIGURES FROM A REAL PASSPORT GENERATED DURING PREP

Seven stages. The score is code, not vibes.

01
Normalize & hash
Validate input, block unsafe URLs (HTTP(S) only, DNS + private-range checks), hash it.
APP

02
Read
URLs read with Tavily Extract. Screenshots go through Tesseract OCR.
TAVILY · OCR

03
Extract claims
Up to five atomic, checkable factual claims, each weighted.
GONKA

04
Find evidence
Live, claim-specific search plus a query designed to find contradictions.
TAVILY

05
Investigate
Two independent investigators assess the same evidence in parallel.
GONKA

06
Challenge
An adversarial pass tries to disprove the leading conclusion.
GONKA

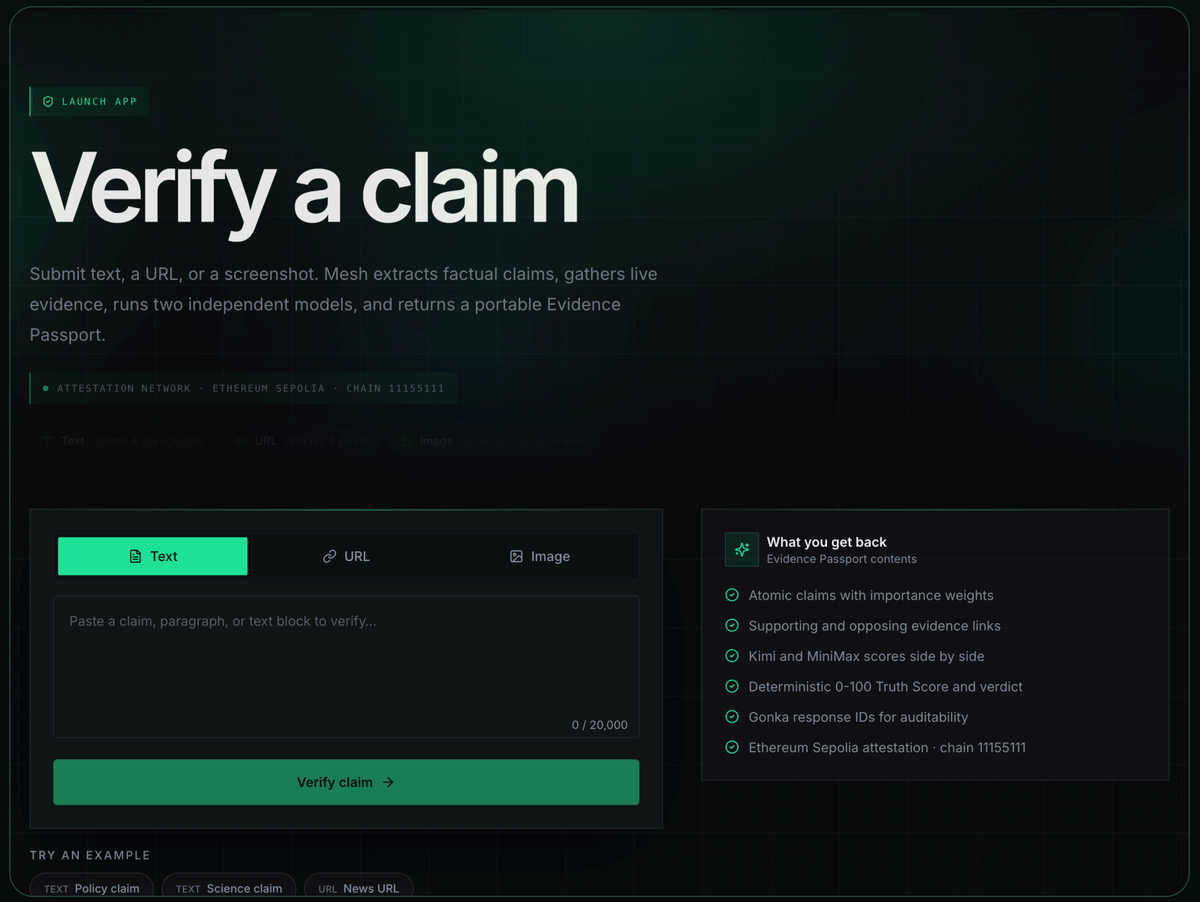

07
Score & seal
Deterministic score, Merkle roots, then a Sepolia attestation.
CODE · CHAIN

Every stage reports progress live to the UI. Every AI call goes through Gonka Router; live evidence comes from Tavily.

Working today. Not a mockup.

Next.js app, NestJS API, PostgreSQL, a Solidity registry on Sepolia, and a Telegram bot, all on one verification pipeline.

- Text, URL or screenshot in
- Streaming progress, stage by stage
- Public passport page, badge and JSON

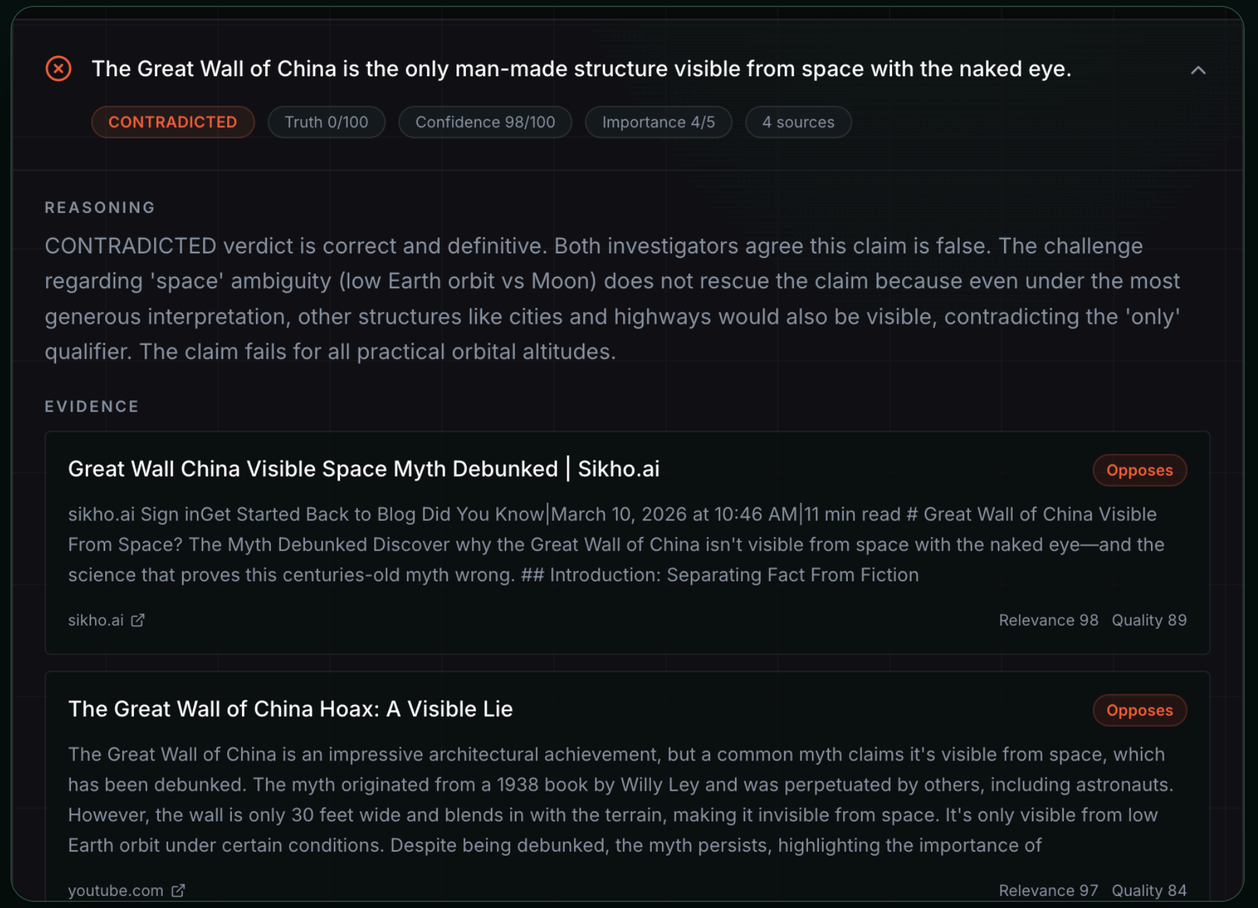

SCREENSHOT OF THE RUNNING APP · VERIFY SCREEN

Claim by claim, source by source.

We ran the classic myth: “The Great Wall is the only man-made structure visible from space with the naked eye.”

CONTRADICTED Claim score 0 / 100

4 opposing sources, each with relevance and quality scores. The overall passport stays Unverified (65) because other atomic claims were only partly supported.

REAL OUTPUT · CLAIM, REASONING AND EVIDENCE

Mesh shows where the answers split.

Two investigators read the same evidence independently. When they differ, the passport says so, and a third pass argues against the leading answer.

Evidence is marked supporting or opposing only when both investigators agree.

REAL OUTPUT · RECORDED DISAGREEMENT AND ADVERSARIAL CHALLENGE

A formula you can audit.

PER-CLAIM SCORE

0.60 × evidence + 0.40 × model mean
− adversarial penalty (capped at 20)

Evidence is weighted by source quality × relevance, and pulled toward 50 until three or more distinct domains agree.
Confidence = model confidence 35% · agreement 25% · domain coverage 25% · source quality 15%.

70–100	Supported
50–69	Unverified
25–49	Misleading
0–24	Contradicted

Models don’t pick the number, and the final narrative can’t change it.

A receipt anyone can recheck.

ON-CHAIN

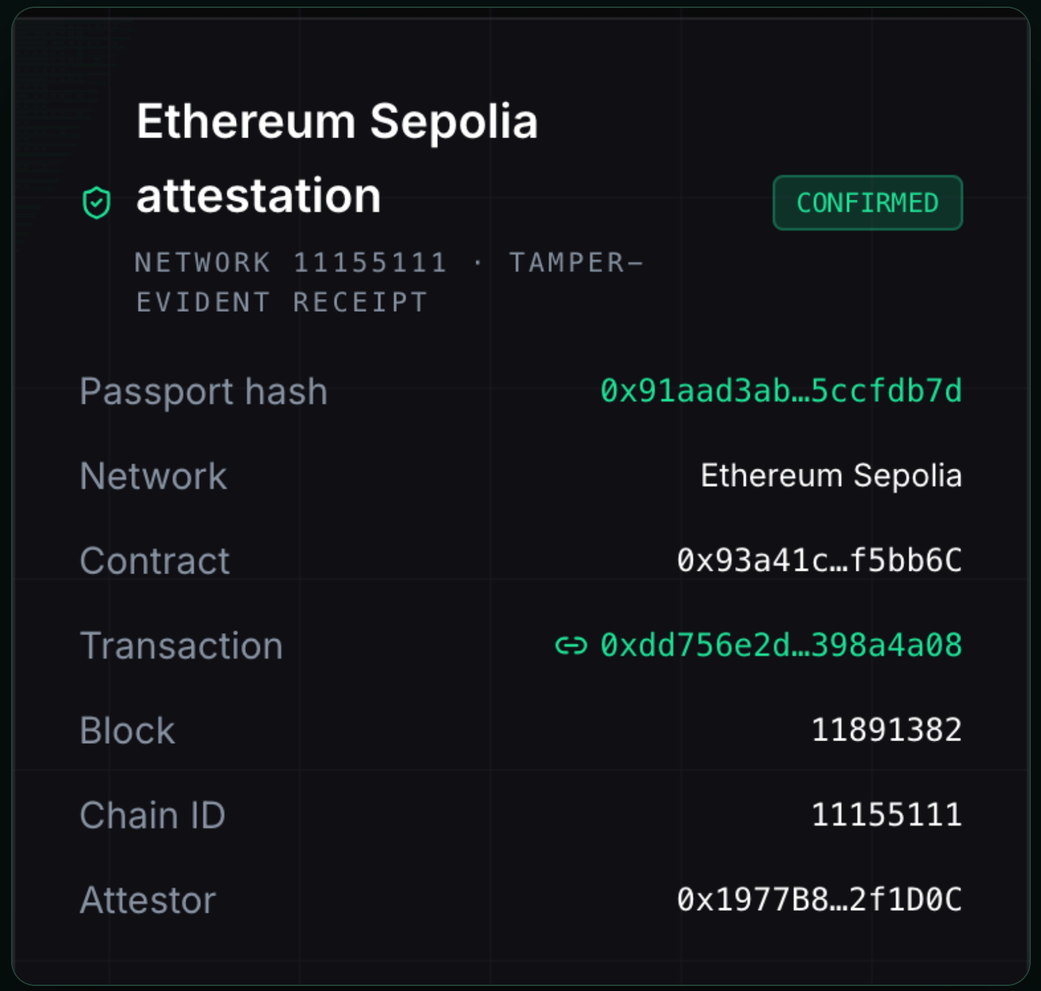

- Passport hash & roots
- Model-output hashes
- Score & version
- Timestamp, attestor

NEVER ON-CHAIN

- The input text
- URLs or evidence
- Model reasoning
- Images

MeshAttestationRegistry · Solidity 0.8.24
0x93a41c639aB78f5aA00345da1AF9E3eacdf5bb6C

Integrity ≠ truth. The chain proves it hasn't changed.

REAL RECEIPT · CONFIRMED IN SEPOLIA BLOCK 11,891,382

One pipeline. Every way in.

WEB

Web app

Verify, explore the public registry, share a passport link or JSON.

TELEGRAM

@mesh_passport_bot

Send text, a link or a photo where claims are actually forwarded.

API

REST + Swagger

Developers and AI agents reuse a passport instead of repeating the work.

BADGE

Embeddable badge

An iframe-safe verdict that links back to the full passport.

For **everyday users** · **journalists & researchers** · **developers & AI agents** · **auditors**

Decentralized inference. Honest limits.

Decentralized AI

Every inference call runs through Gonka Router. No single provider defines the answer, and models are swappable, with fallback when one is retired.

Live evidence

Tavily retrieves current sources for each claim, with titles, dates, excerpts and quality, and a query built to find contradictions.

Guardrails shipped

SSRF and DNS checks, MIME and 5 MB limits, schema validation, rate limits, server-only secrets, hashes-only on-chain.

HONEST LIMITS

AI can be wrong · prompt-injection defenses are basic · OCR is English-only · a score is an assessment, not an oracle.

PROPOSED ROADMAP

From a one-time check to living evidence.

Mesh Memory

One claim graph across posts, screenshots and translations.

Living Passports + Watch

Immutable versions and one alert when evidence really changes.

Lens + Share-to-Mesh

Context where claims appear: browser layer, Telegram, WhatsApp pilot.

MCP + Trust Policy

Typed tools for agents; high-risk actions escalate when evidence is stale.

MethodHash

Attest the method and version, not just the artifact.

Mesh Bench + Firewall

Public accuracy metrics; retrieved text treated as untrusted input.

Gated pilots, only after the foundations are measurable: audit cases · market resolution dossiers · evidence bounties · zkTLS private-source proofs · zero-knowledge passports. A score never moves money by itself.

Evidence assessment ≠ cryptographic integrity ≠ real-world truth

Where incubation helps most.

01

Prove the quality

A frozen benchmark, citation exactness, honest abstention, and a real defense against prompt injection from retrieved pages.

02

Go where claims live

WhatsApp pilot, browser extension, TypeScript SDK and MCP server, so a passport appears at the moment of sharing.

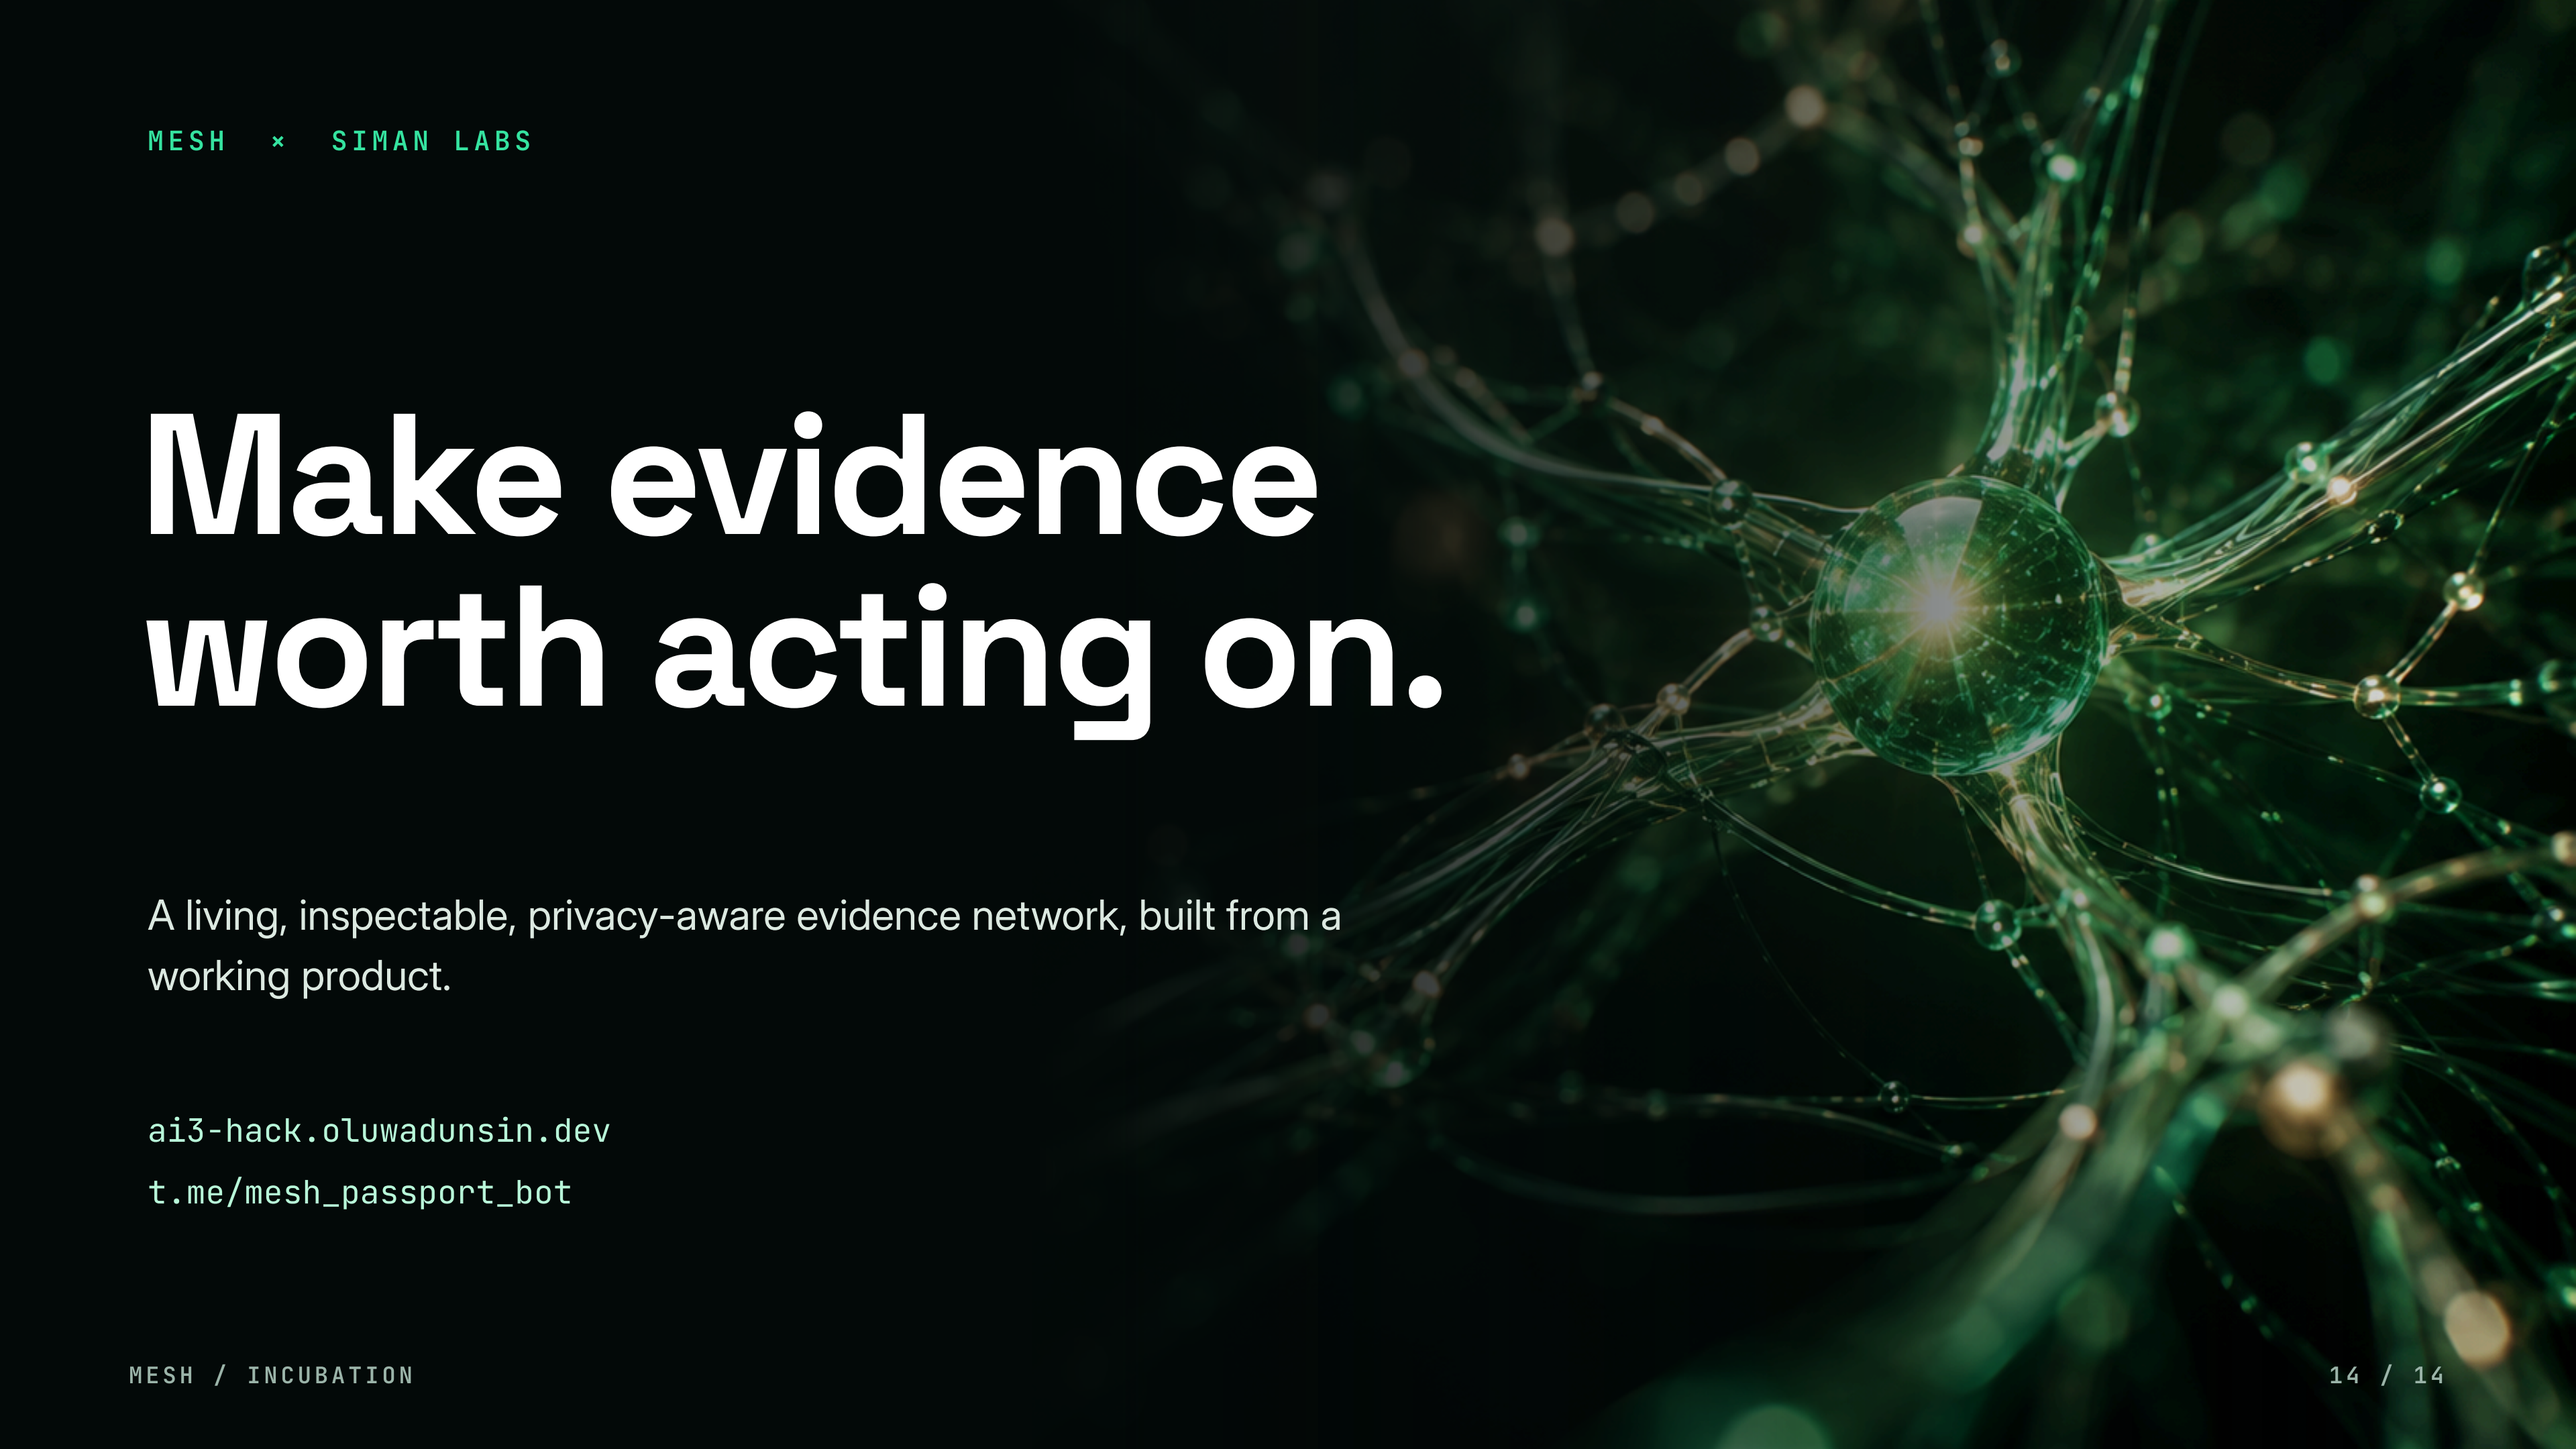

03

Find launch partners

Newsrooms, fact-checkers and communities to pilot with, so passports are reused instead of recreated.

Our ask: mentorship, pilot partners and distribution.

Make evidence worth acting on.

A living, inspectable, privacy-aware evidence network, built from a working product.
